[P44-A]

584 Marriages are not arranged against
586 the will of either party, and although
divorce is legally very easy for men
593 or women, it is not common. Women
are neither abused nor overworked,
and the mother is the respected chief
of the house, as the father is of the
[581] farm. Marriage does not encompass
[562] companionship as we know it: men
spend their spare time in the company
of other men, and women visit exclu-
562 sively with other women. They hold
535 their dances on separate threshing
floors a half-mile or so apart, on the
same night, and woe betide the eager
teen-age boy who dresses in his sister's
clothes and sneaks into a girls' dance.

262 At the time of the Tumushuling,
[296] and only then, Hunza families
butcher a sheep or two; cold weather
231 preserves the meat for the few days
[251] before it is all eaten—and it *is* virtually
all eaten. Even the long bones are
cracked to extract the last marrow.
After this taste of meat, the winter of
the dietary year sets in. Gradually the
supply of carrots and potatoes fails,
then the wheat, the barley, the dried
[146] apricots, and the tea. By springtime
the poorer folk may eat only once in
two days. No one starves to death, but
no one has enough to stop hunger.

146 The regular Hunza diet has no fats,
no animal proteins, no vitamin A, no
vitamin D, a deficiency of vitamin B,
and a serious deficiency of calcium.
Apricots contain some sugar and vita-
min C, but the poorer families are un-
245 able to raise large crops. (The size
556 of apricot orchards determines a
man's wealth and status.) Hunzas use
372 every bit of the apricot, as they do of
824 the sheep. They cut the pits from the
fruits, crack them, and remove the al-
[412] mond-like nuts. The women hand-
grind these with stone mortars, then
squeeze the meal between a hand-stone
and a flat rock to express the oil. Apri-
[359] cot oil is fuel for the saucer-shaped
lamps that illuminate their homes, as
lamps of this type have done since the
824 Bronze Age. The oil is very bitter, na-
278 turally enough, because of its high
content of prussic acid, fifty drops of
which are said to be lethal in about
[273] four hours. Men add a few drops, as
[262] bitters, to their wine, and occasion-
ally a despondent woman takes a dose
in order to commit suicide.

164 Mild cases of rickets and scurvy
146 are rampant every spring—not enough
to kill, just enough to loosen teeth,
cause aching knees, and deform ribs
